Keep Food Out of the “Danger Zone”

Leaving food out too long at room temperature can cause bacteria (such as Staphylococcus aureus, Salmonella enteritidis, Escherichia coli O157:H7, and Campylobacter) to grow to dangerous levels that can cause illness. Bacteria grow most rapidly in the range of temperatures between 40°F and 140°F, doubling in as little as 20 minutes. This range of temperatures is often called the “Danger Zone.”

Cooking

Raw meat and poultry should always be cooked to a safe minimum internal temperature (see graphic). When roasting meat and poultry, use an oven temperature no lower than 325°F. If you aren’t going to serve hot food right away, it’s important to keep it at 140°F or above.

Storing Leftovers

One of the most common causes of foodborne illness is improper cooling of cooked foods. Bacteria can be reintroduced to food after it is safely cooked. For this reason leftovers must be put in shallow containers for quick cooling and refrigerated at 40°F or below within two hours.

Reheating

Foods should be reheated thoroughly to an internal temperature of 165°F or until hot and steaming. In the microwave oven, cover food and rotate so it heats evenly.

*Never leave food out of refrigeration over 2 hours. If the temperature is above 90°F, food should not be left out more than 1 hour.
